Today's Threat Modeling Theme

Keep it simple.

Objective:

Provide a framework to facilitate a threat modeling roundtable

What is a Threat?

- Anything (e.g., object, human) capable of performing unauthorized actions against a software system
- Possess **skills, access, and resources**

OWASP NoVA Chapter: https://groups.google.com/forum/#!forum/novaowasp_threatmodeling

Threat Example – Mobile Architecture

Malicious Device User (1)

Skills

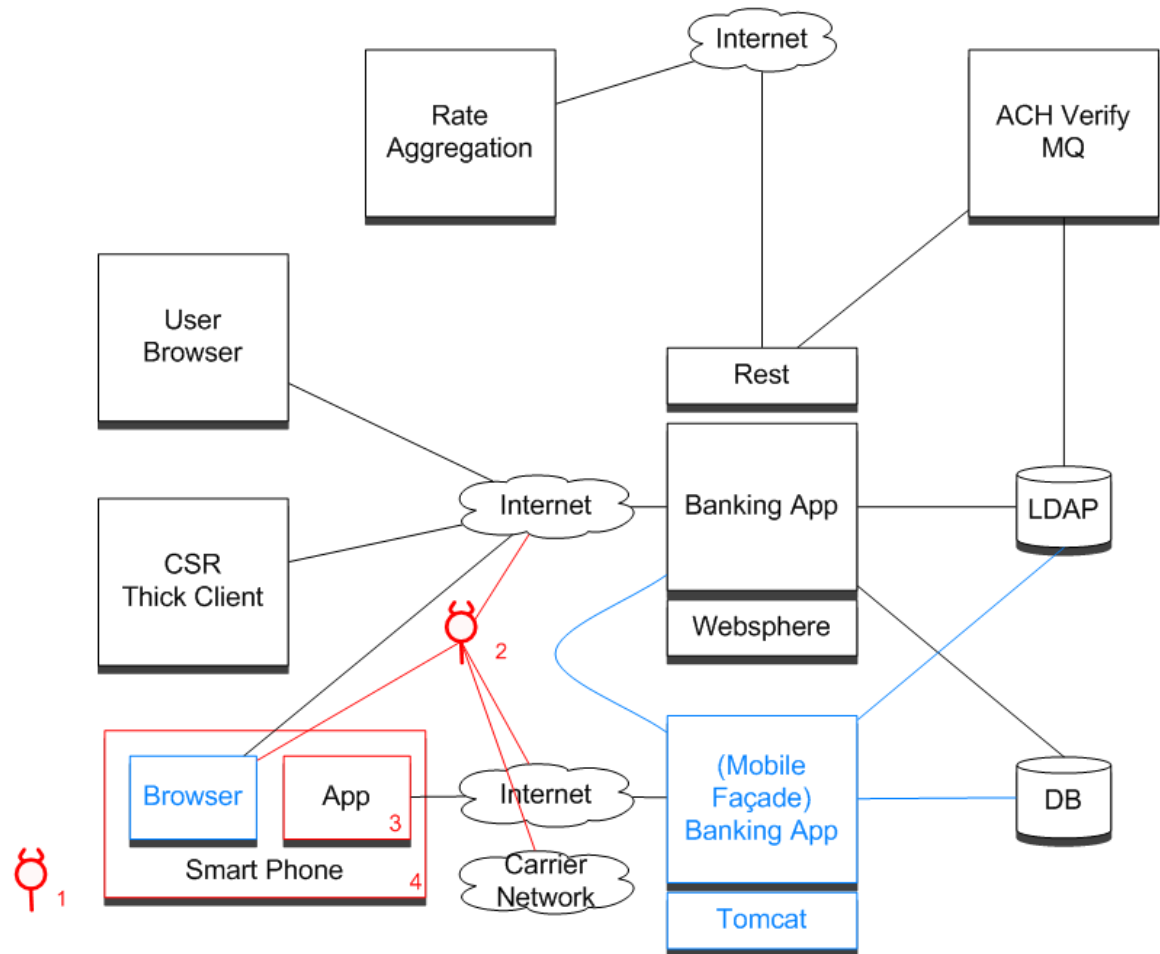

- Jailbreak device
- Reverse engineer software
- Install/modify software

Access

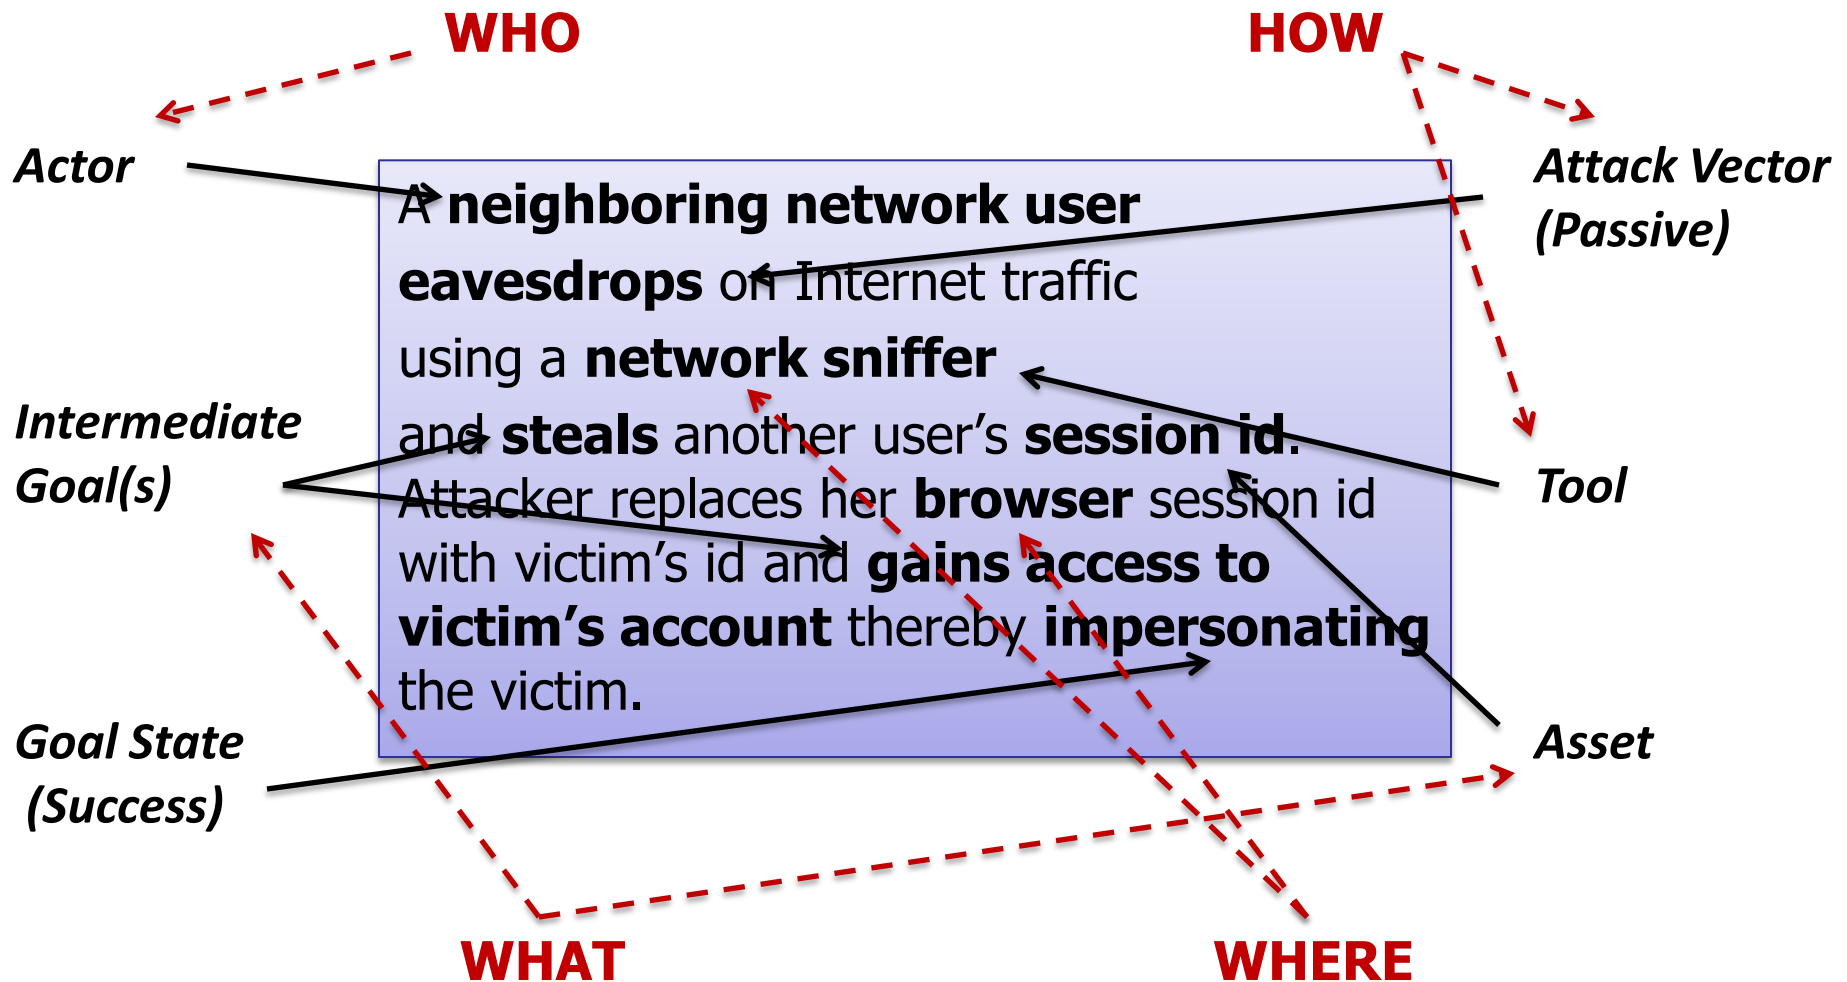

- Access to device
- Access to apps/browsers
- Access to device SDK

Resources

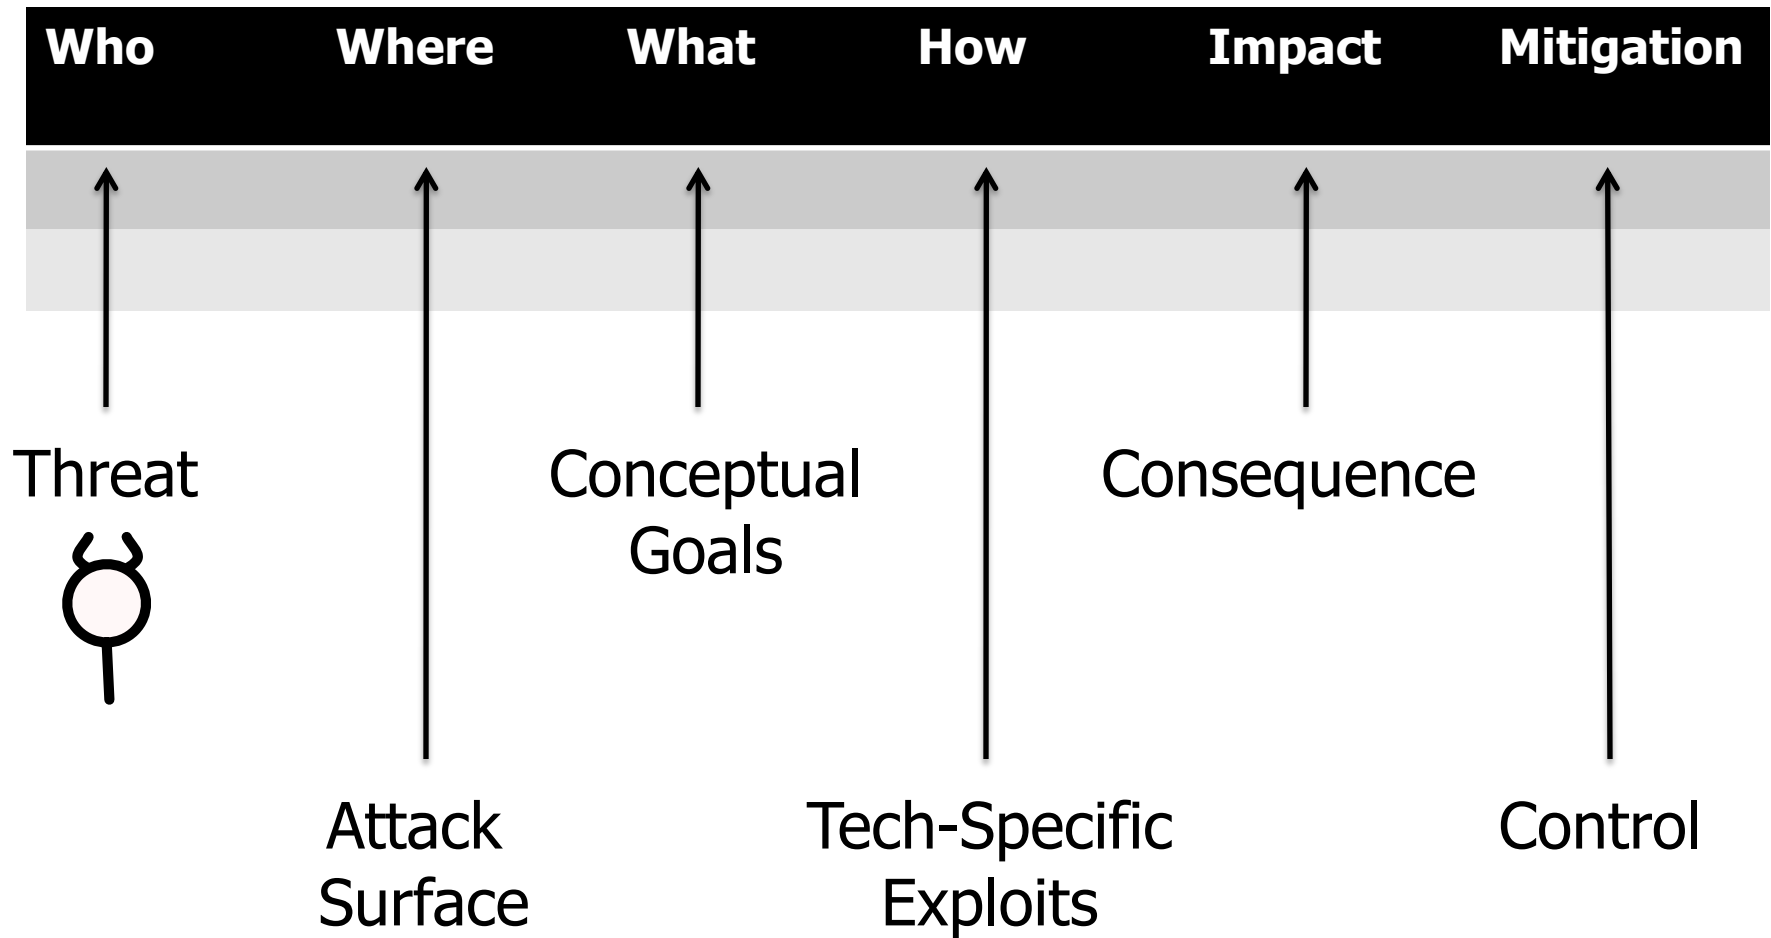

- Possess device/app credentials
- Disassemblers, proxies

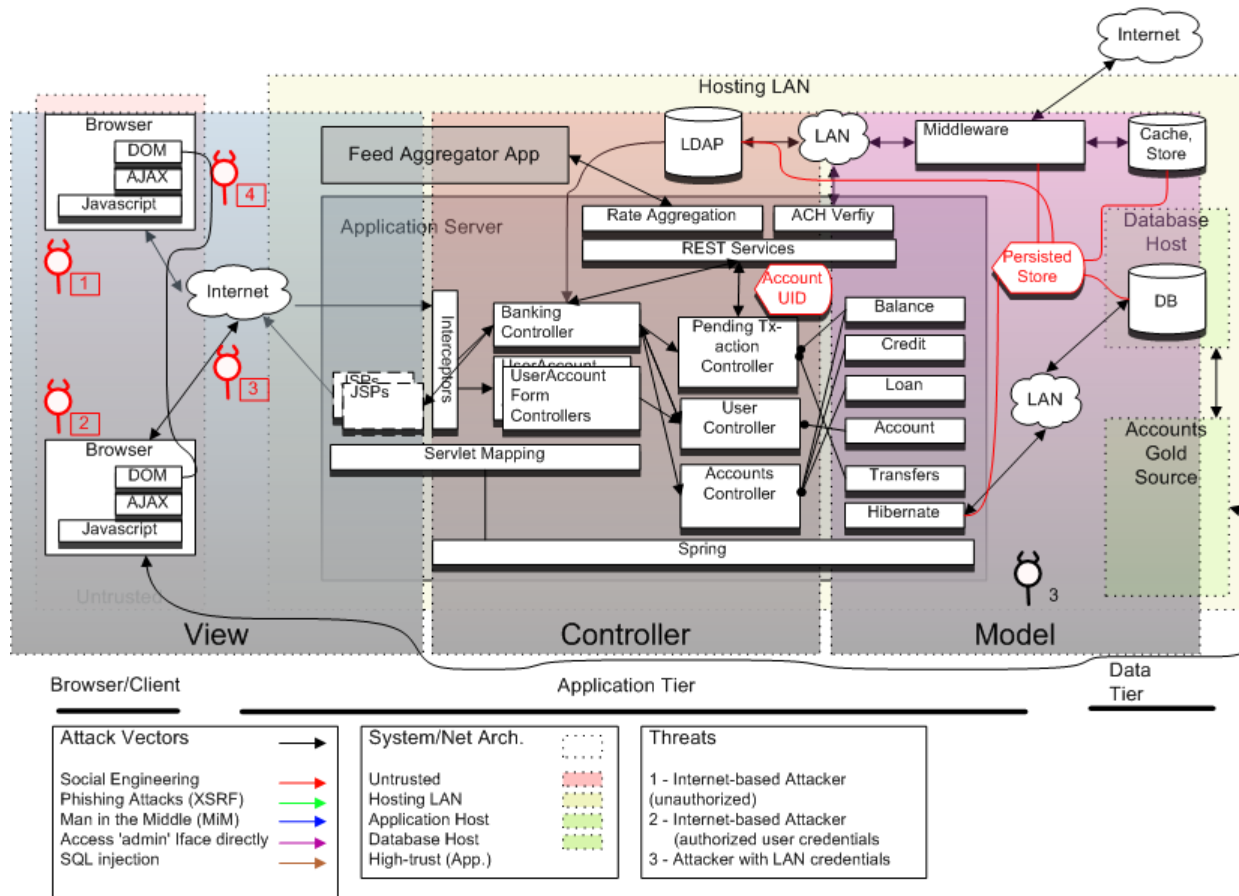

Anatomy of an Attack

Threat Traceability Matrix

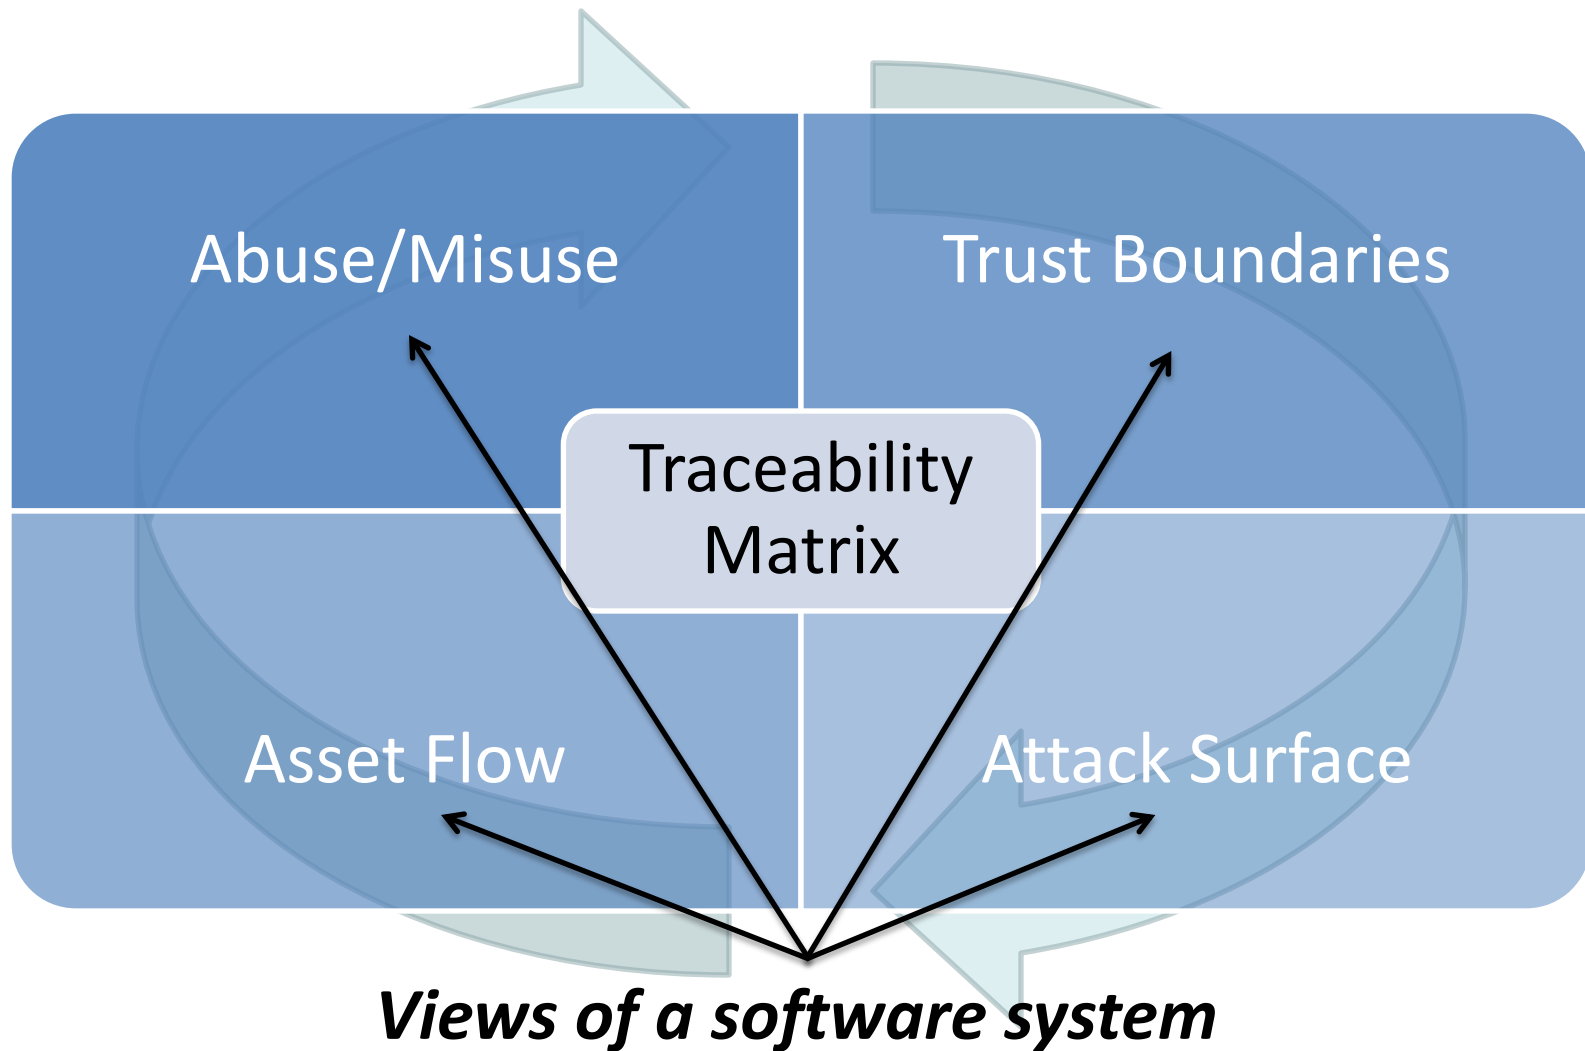

Elements of a Threat Model

- **Software architecture** – structure, interaction, control flow, frameworks, services, design patterns
- **Threats**
- **Assets** (data and function)
- **Attack Vectors**
- **Security Controls**
- Notion of **'trust'**

Simplified Threat Modeling Framework

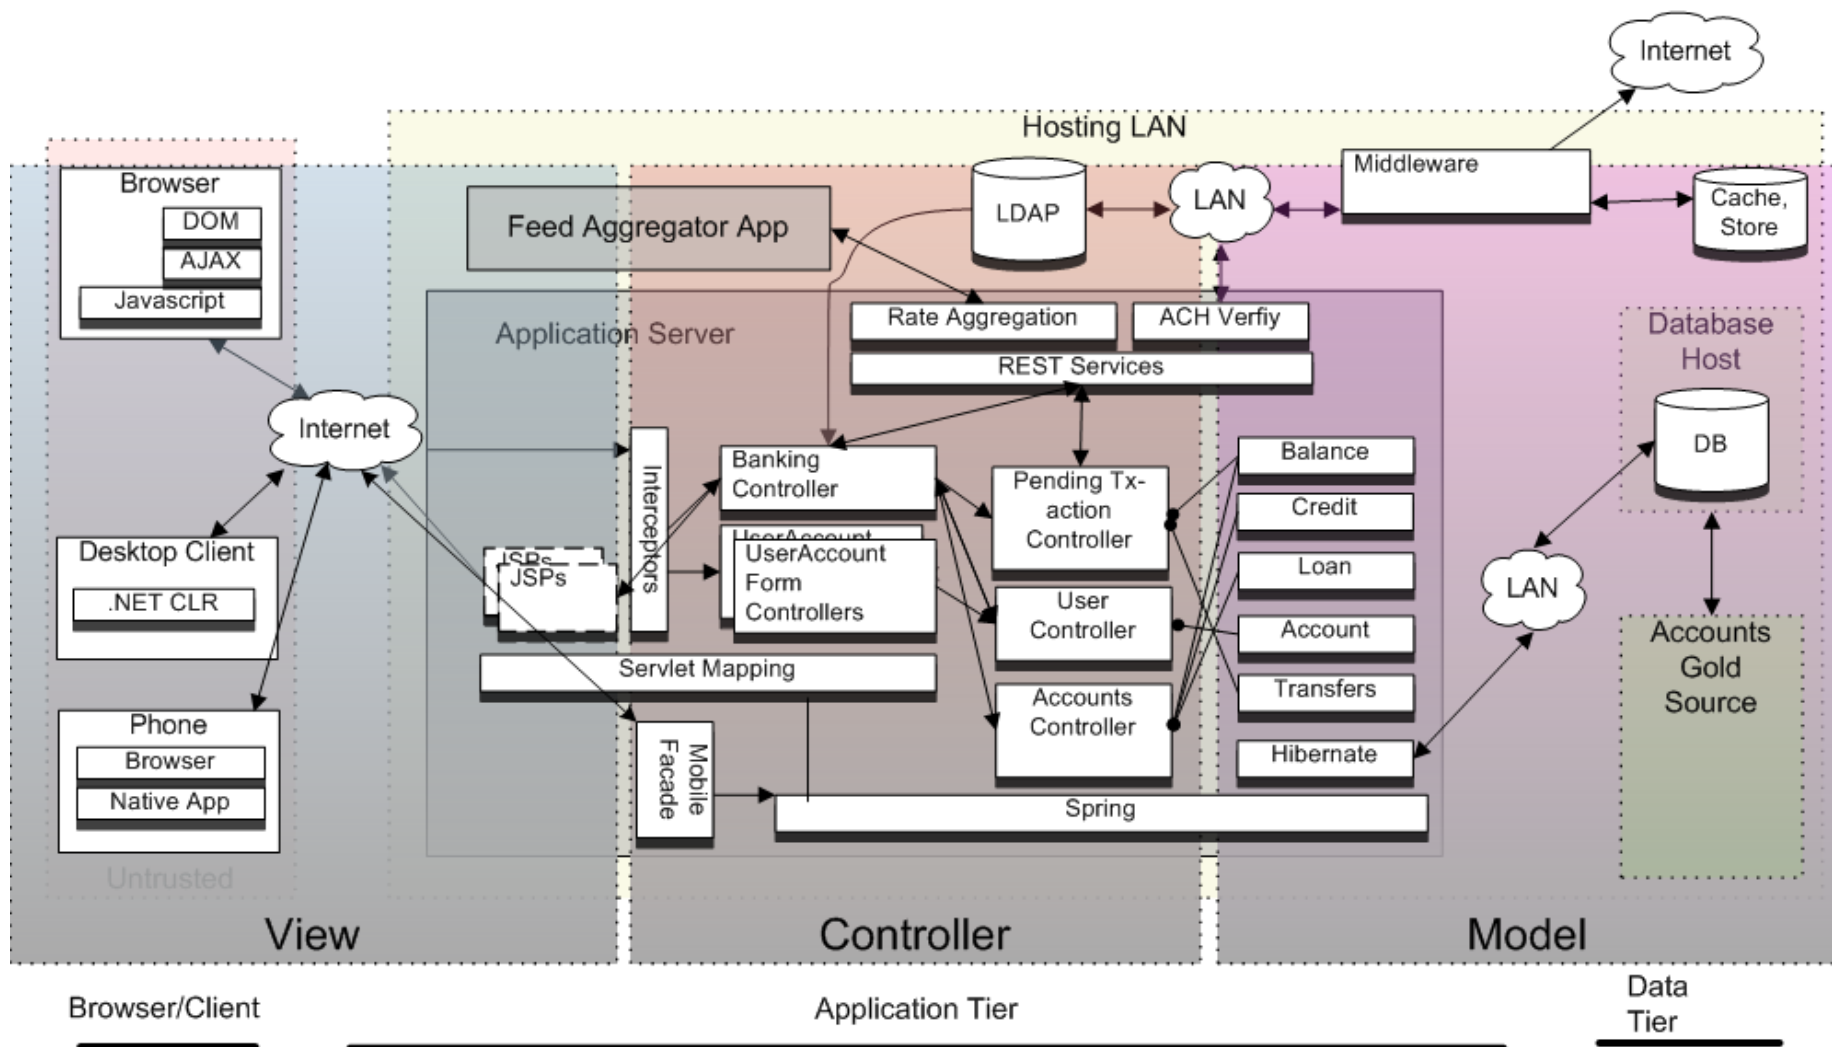

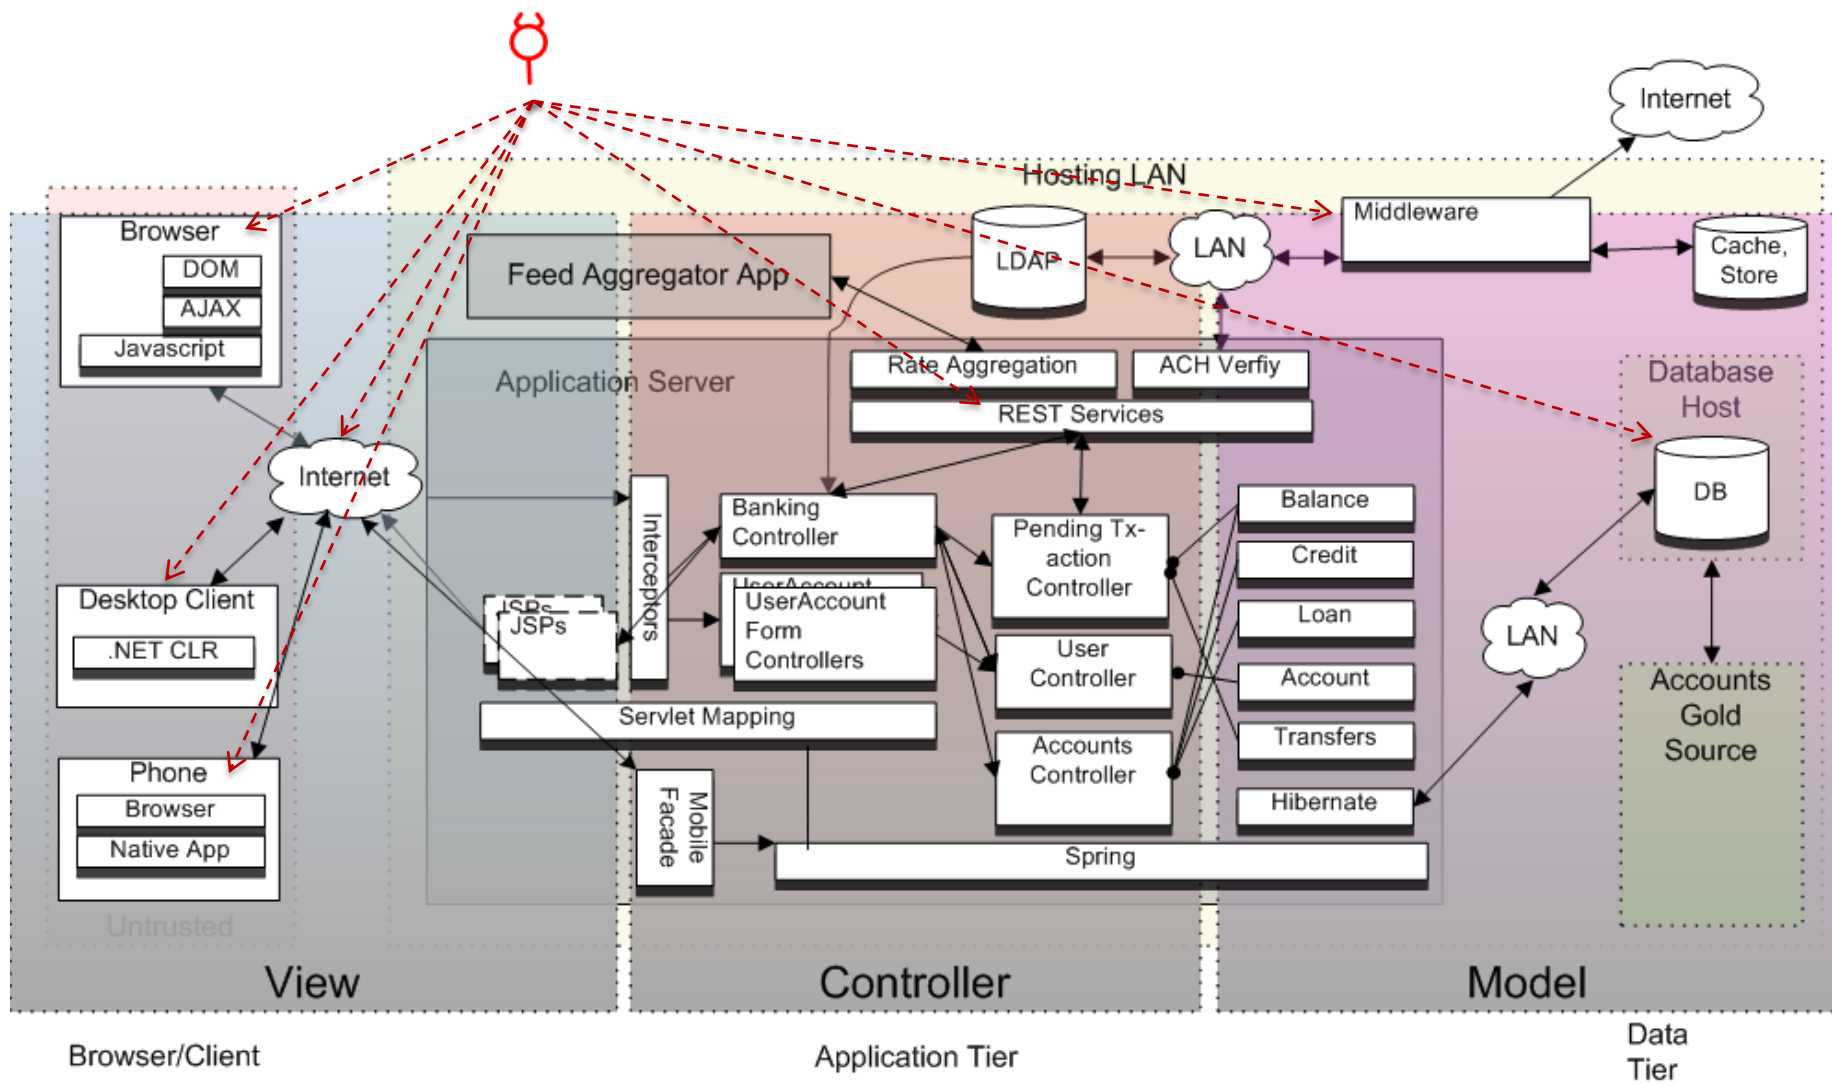

Keep it simple.

7+1 Threat Modeling Steps

1. Diagram Software Architecture

2. Enumerate Attack Surface(s)

Attack Surface View

- Gluers
- Builders
- Breakers
- Defenders

Viewpoints

- Design/architecture changes
- Integration with:
 - Frameworks, toolkits, 3rd party libraries
 - Partners, service providers
 - Other enterprise systems
- Discovery, mapping, and other tool usage
- 'WHERE' traceability matrix column

Characteristics

- Interfaces enabling interaction
 - Web, services, middleware, data tier, etc.
- Interaction model
 - Synch, async, transactional
 - Stateful, stateless
- Technology enabling interaction
- Authentication/authorization

SDLC

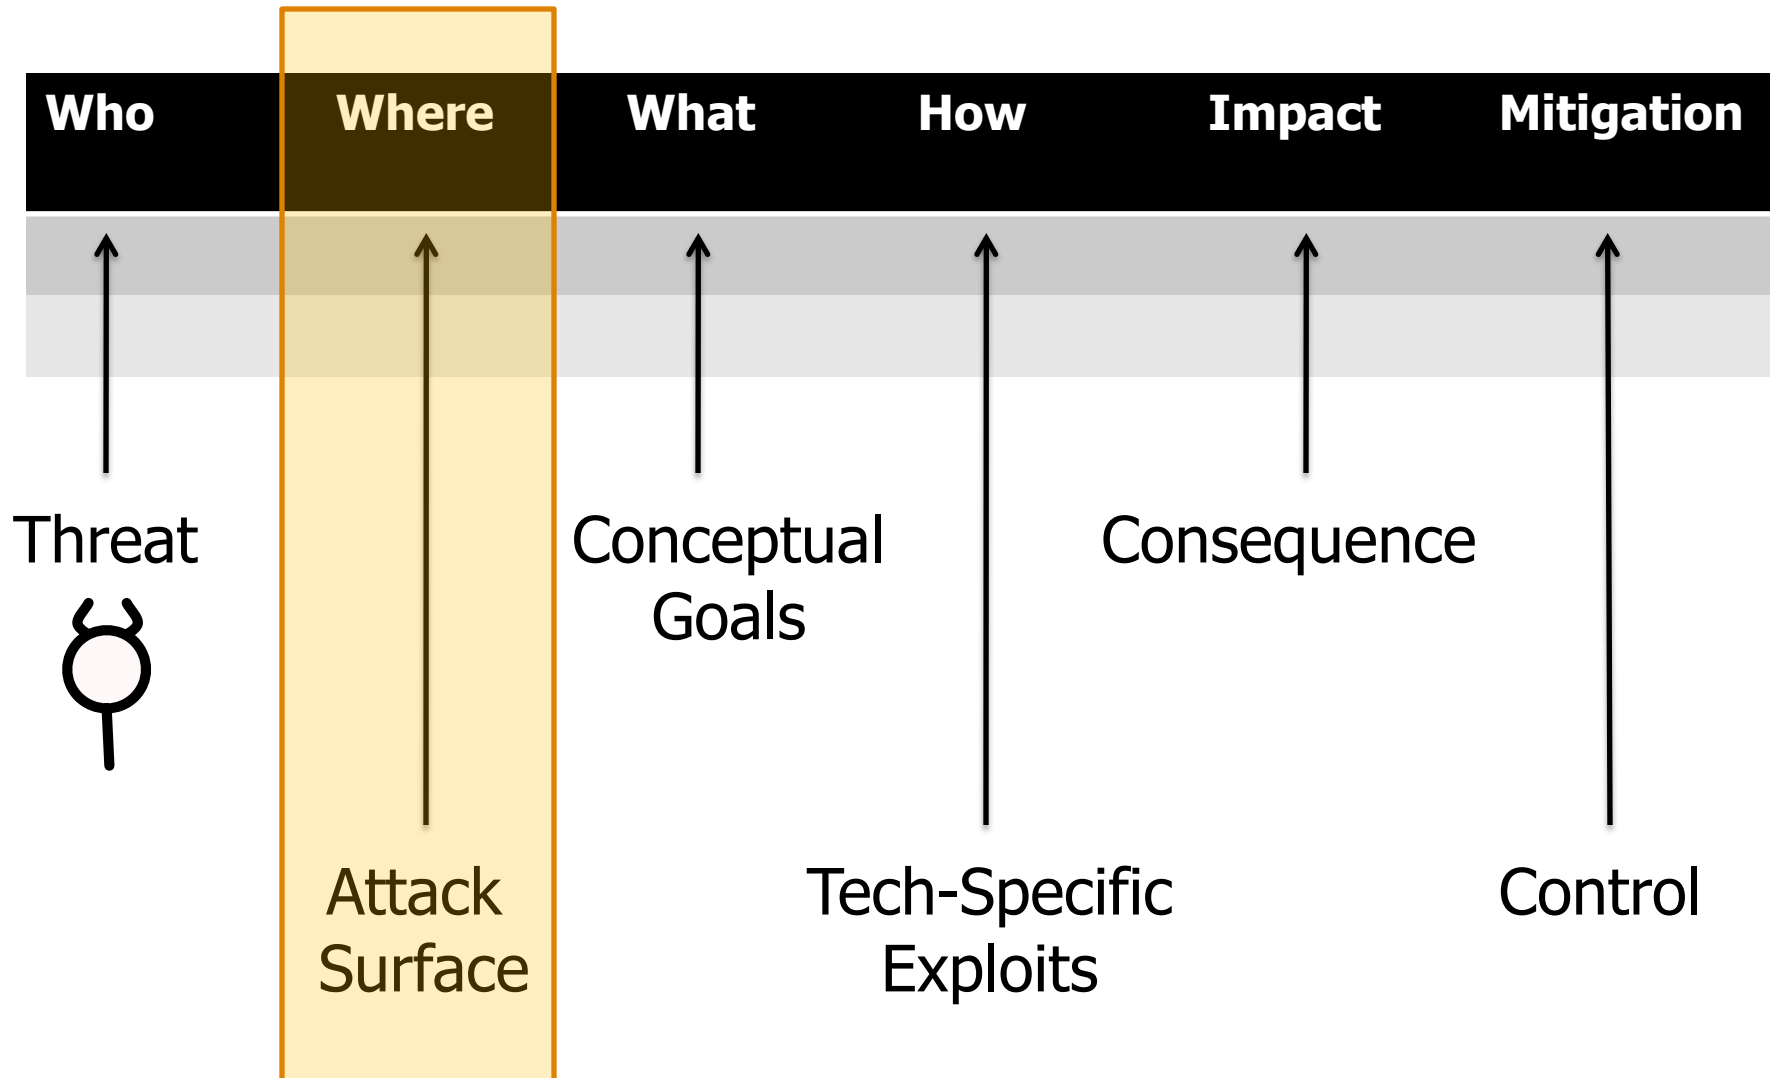

Design

- High level architecture
- Low level design

Inputs/Usage

Threat Traceability Matrix

3. Each User Class Becomes a Threat

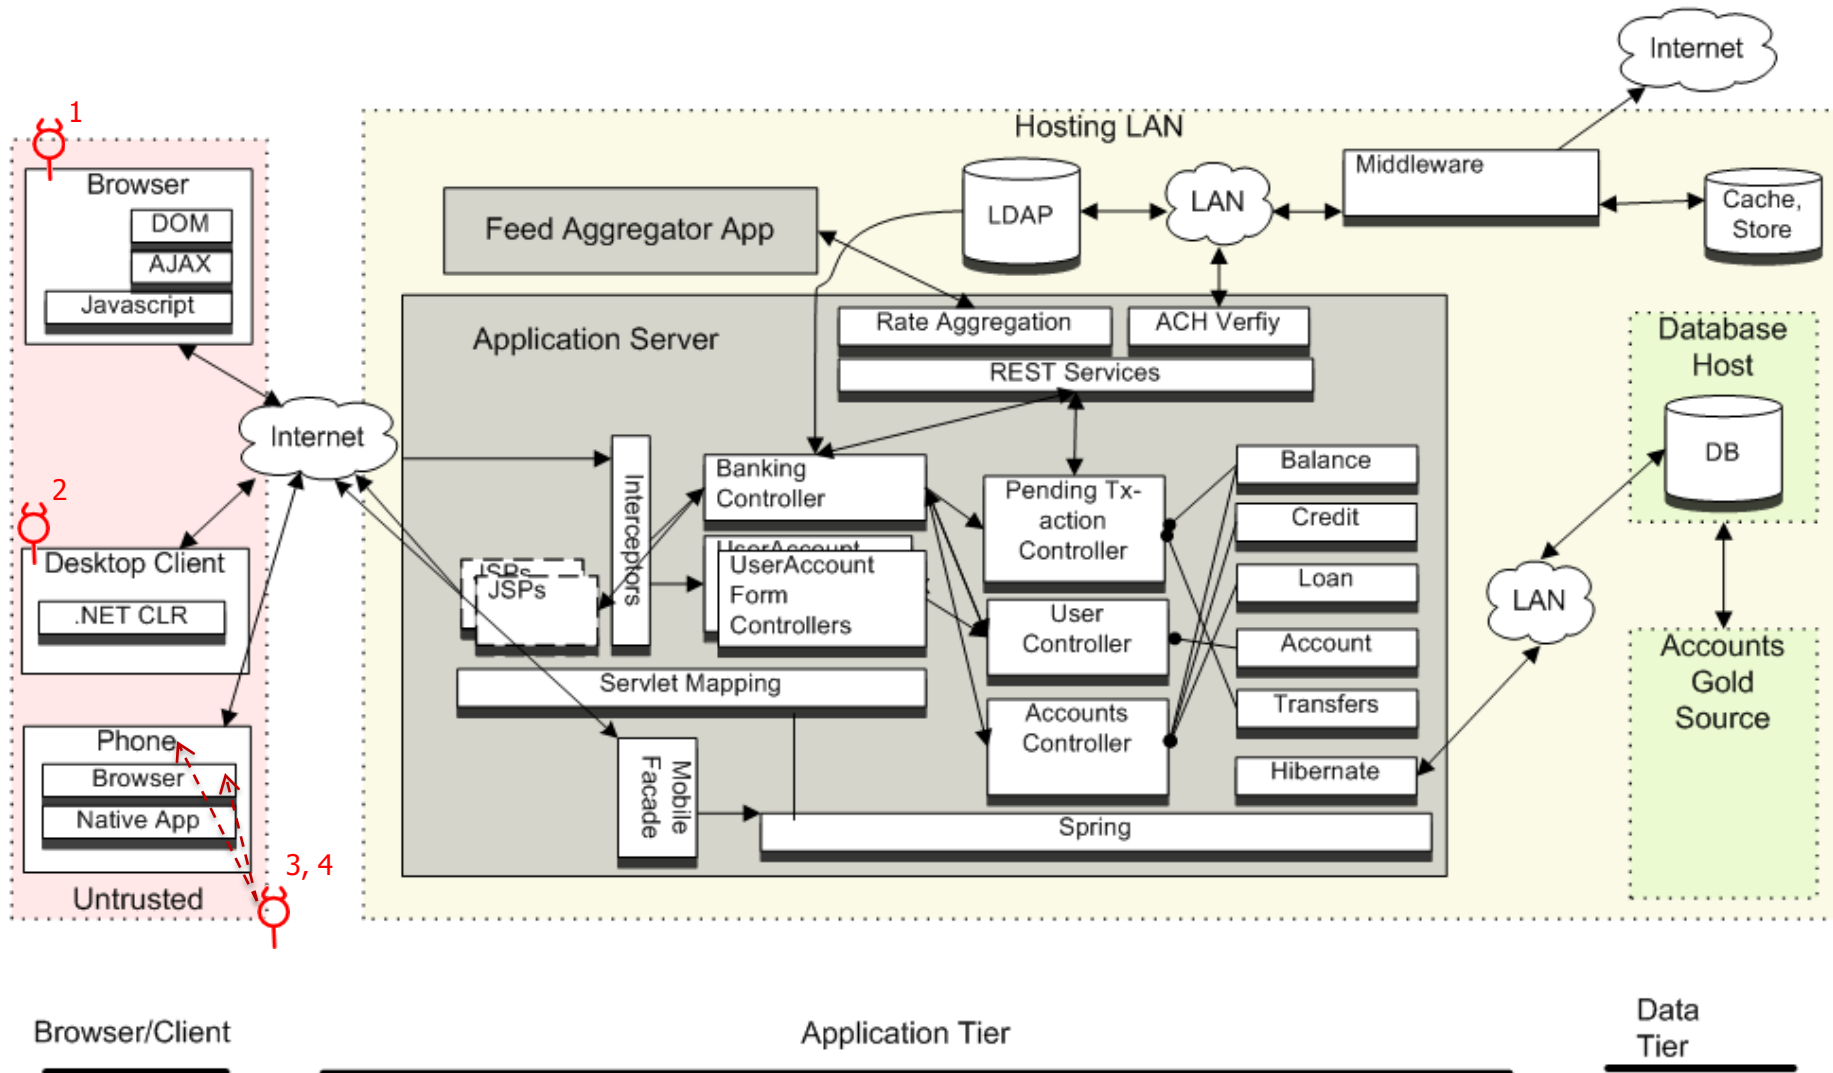

User	Threat	Malicious Intent	Non-Malicious Behavior
Account Holder	Malicious Customer	Fraud, steal money, sabotage accounts	Inadvertent account lockout
Customer Support Representative (CSR)	Malicious CSR	Sell sensitive customer information	Backup customer data
Phone User	Malicious Device User	Install malware, reverse engineer app, jailbreak phone	Lose phone

Malicious Intent Creates New Threat

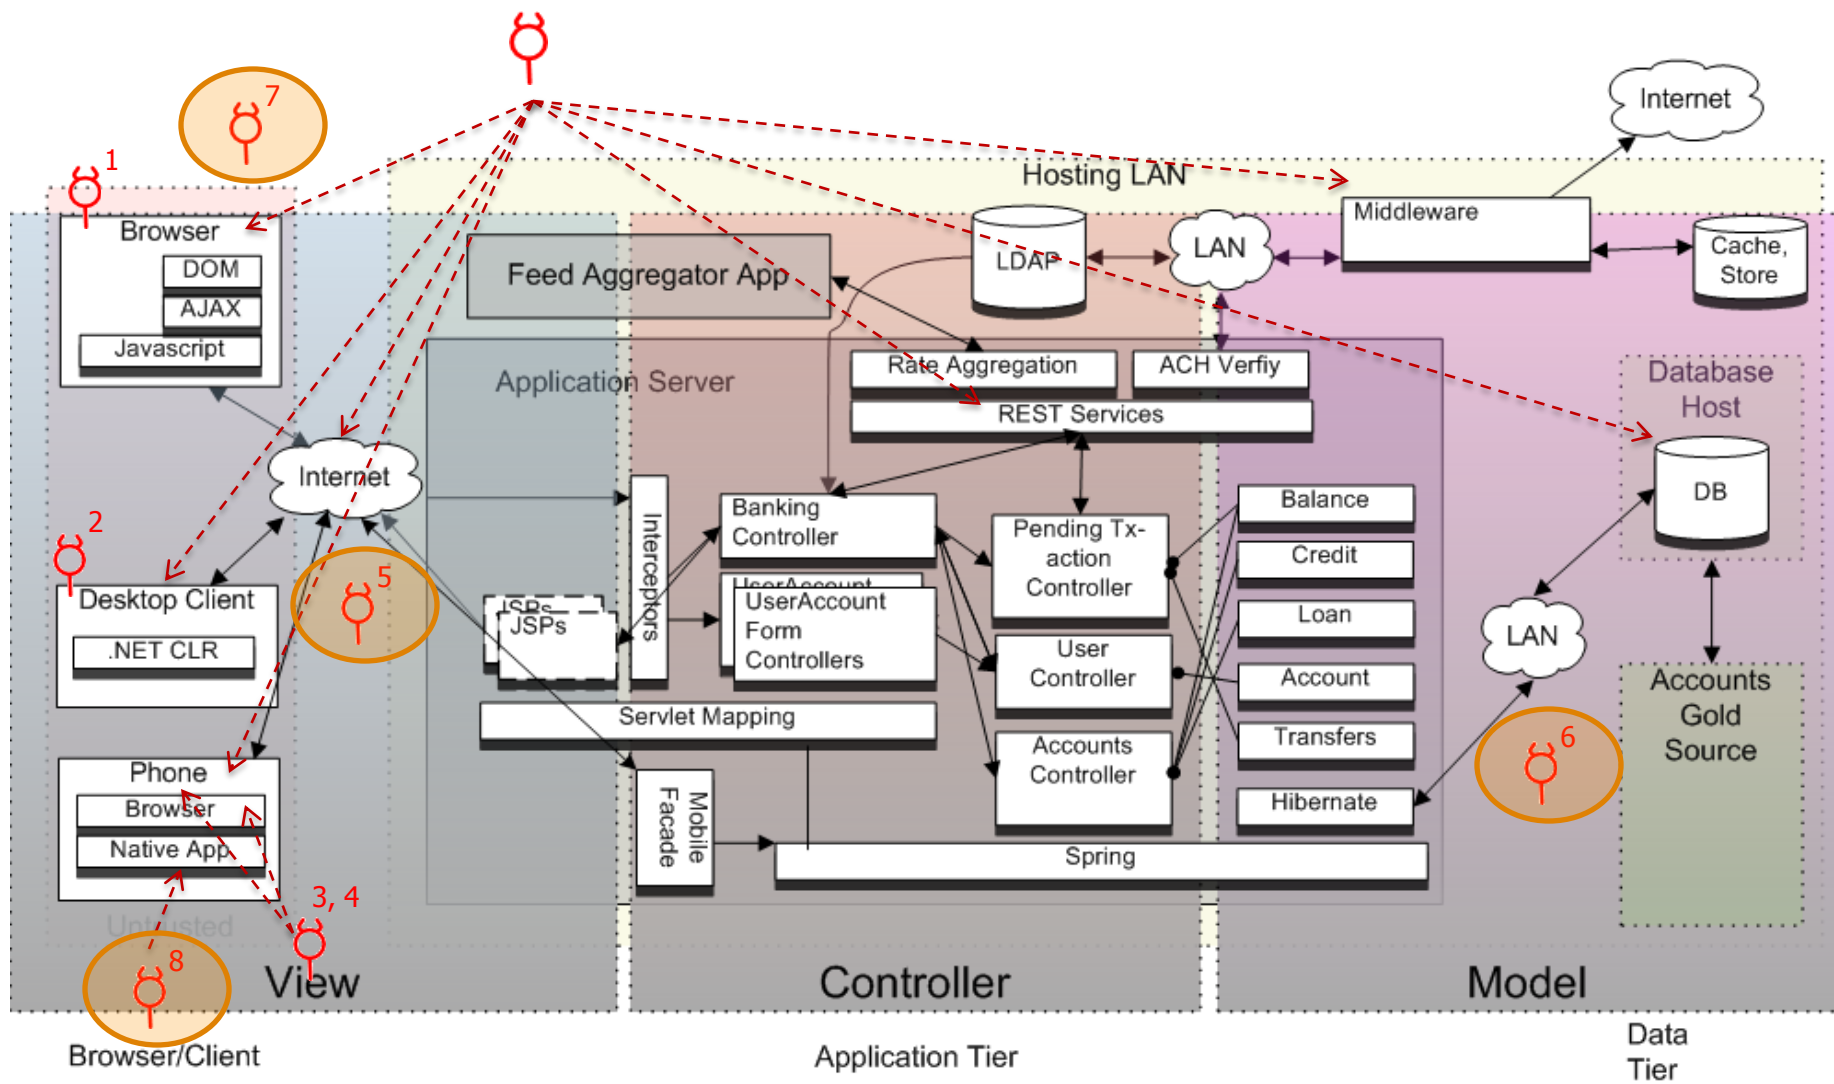

User	Threat	Malicious Intent	Non-Malicious Behavior
Account Holder	Malicious Customer	Fraud, steal money, sabotage accounts	Inadvertent account lockout
Customer Support Representative (CSR)	Malicious CSR	Sell sensitive customer information	Backup customer data
Phone User	Malicious Device User	Install malware, reverse engineer app, jailbreak phone	Lose phone

Malicious Device ←

Visualize Normal Users as Threats

Re-consider Attack Surface(s)

Abuse/Misuse Case View

- Owners
 - Business
 - Product
 - Requirements
- Breakers

Viewpoints

- Use cases, user story elicitation
- High level requirements definition
- List of threat actor profiles
 - Skills
 - Access
 - Resources

- Link abuse/misuse to 'WHERE'
- 'WHO', 'WHAT', 'HOW'

Characteristics

- Abuser/misuser (actor)
- System interface to actor (attack surface)
- Preconditions
- Inputs
- Actor's actions
- Expected outcomes

SDLC

Requirements

- Functional
- Non-functional

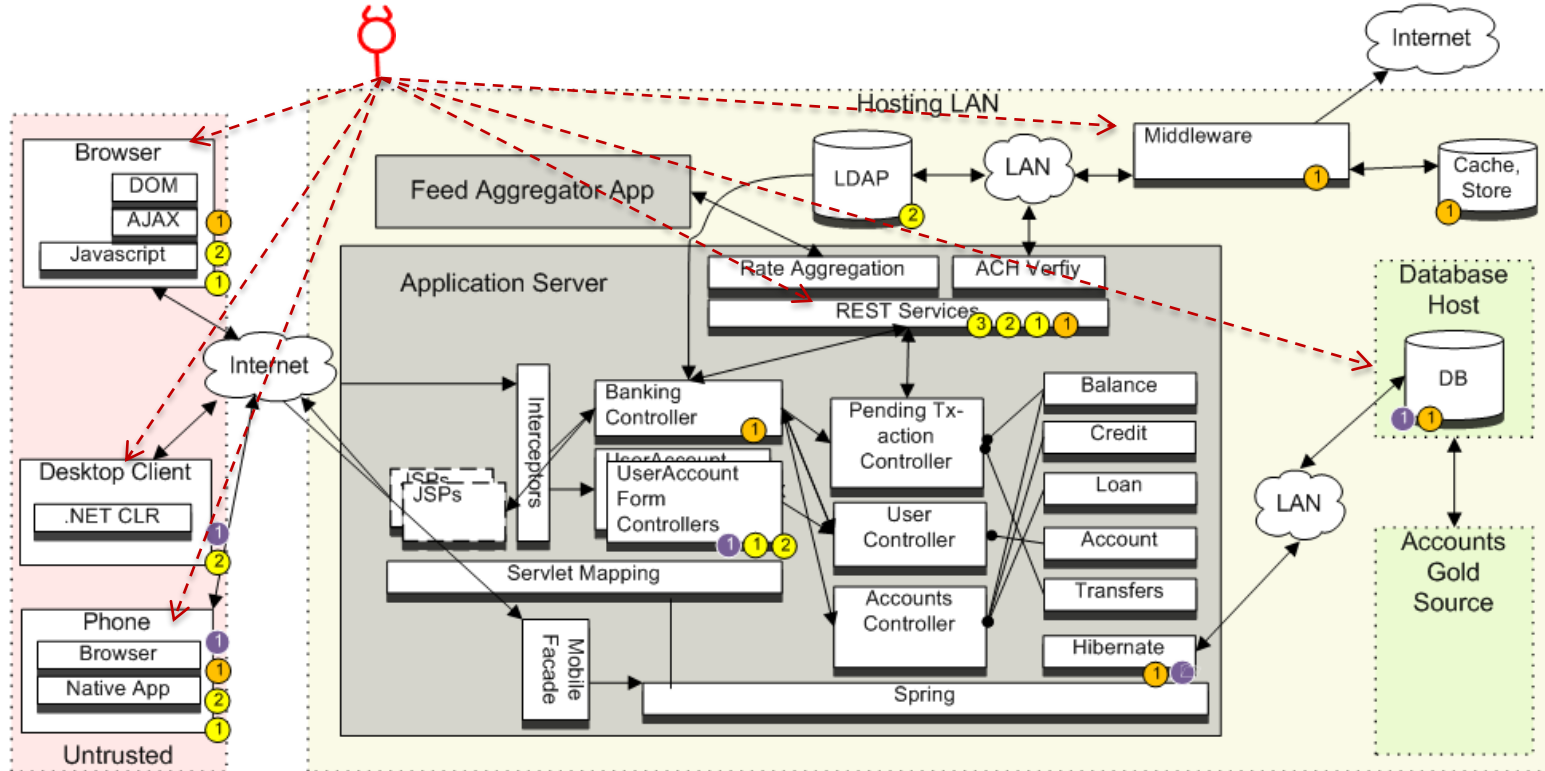

Inputs/Usage

Capture 'Who', 'Where', and 'What'

Who	Where	What	How	Impact	Mitigation
1. Malicious Account Holder	User's Browser	• Execute fraudulent transactions			
2. Malicious CSR	Desktop Client	• Steal customer PII			
4. Malicious Mobile Device	Phone OS, SDK	• Capture and transfer application data			
7. Malicious Third Party	User's Browser	• Steal user credentials			

4. Illuminate Assets

Browser/Client

Application Tier

Data Tier

- ① Session Identifier
- ② Credentials
- ③ Principal
- ④ PII
- ⑤ Account Info: balance, IDs, withdrawal, deposit, transfer

Asset Flow View

- Owners
 - Risk (IRM)
- Gluers
- Builders
- Breakers

Viewpoints

- Data View + CRUD
- Schemas, config, DTDs
- SCR, VA assessment results
- Enhance 'WHAT', 'HOW' with contextual information
- Evaluate 'IMPACT' of abuse/misuse

Characteristics

- Data and functionality
- Threat agent(s) level of access
- Exposure to attack surface(s)
- Asset classification
- Protection mechanisms
 - Rest, process, transit
 - Egress, ingress
- Qualifying technologies

SDLC

Requirements

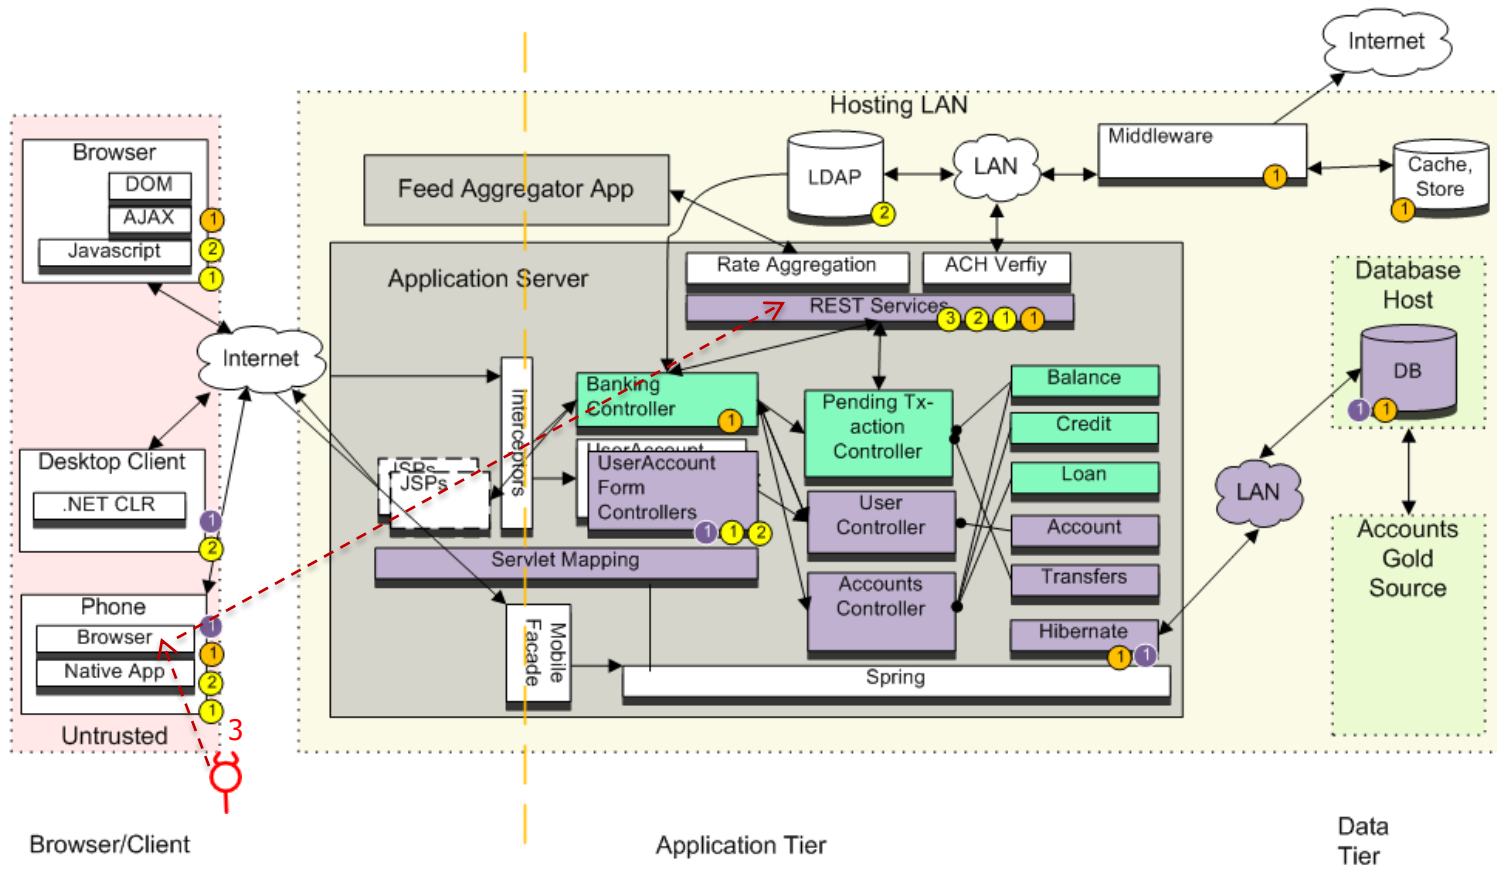

Design

- Information architecture
- High level architecture diagram

Inputs/Usage

5. Illuminate Trust Boundaries

- ① Session Identifier
- ② Credentials
- ③ Principal
- ④ PII
- ⑤ Account Info: balance, IDs, withdrawal, deposit, transfer

- Input Presumed Validated
- User Presumed Authenticated
- Acct GUID Presumed Protected

6. Postulate Attacks Against Assets

Who	Where	What	How	Impact	Mitigation
3. Malicious Mobile Device User (unauthenticated)	User's Browser, Native Phone App	Execute fraudulent transactions	<ul style="list-style-type: none">• Directly make REST API requests using another customer's account identifier• CSRF attack against another customer		

7. Evaluate Impact

Who	Where	What	How	Impact	Mitigation
3. Malicious Mobile Device User (unauthenticated)	User's Browser, Native Phone App	Execute fraudulent transactions	<ul style="list-style-type: none">• Directly make REST API requests using another customer's account identifier• CSRF attack against another customer	<ul style="list-style-type: none">• Fines• Brand damage (PR incident)	
4. Authenticated Malicious User	User's Browser, Native Phone App	Modify user account information		<ul style="list-style-type: none">• Account recovery costs• Lose customer(s)	

Red arrows indicate traceability from the 'Who' column to the 'How' column and from the 'How' column to the 'Impact' column. Specifically, an arrow points from '3. Malicious Mobile Device User (unauthenticated)' to the 'How' column, and another arrow points from the 'How' column to 'Impact'. A third arrow points from '4. Authenticated Malicious User' to the 'How' column, and a fourth arrow points from the 'How' column to 'Impact'.

8. Mitigate

Who	Where	What	How	Impact	Mitigation
3. Malicious Mobile Device User (unauthenticated)	User's Browser, Native Phone App	Execute fraudulent transactions	<ul style="list-style-type: none">• Directly make REST API requests using another customer's account identifier• CSRF attack against another customer	<ul style="list-style-type: none">• Fines• Brand damage• Account recovery costs	<p><u>R.1.a:</u> Authenticate REST API requests (user level)</p> <p><u>R.1.b:</u> Authorize all REST API calls (message level)</p> <p><u>S.1.a:</u> Implement request tokens for all state changing servlets</p>

Trust Boundaries View

- Gluers
- Breakers
- Defenders

Viewpoints

- 'Attack Surface View'
- 'Asset Flow View'

- Postulate 'HOWs' by speculating about weaknesses in trust boundary implementations

Characteristics

- Boundaries defined by set of security properties
 - AuthN/AuthZ
 - I/O Controls
 - Privileged functionality/data
 - Connections & protocols
 - Object marshaling and remoting
 - Queues, channels
 - ...

SDLC

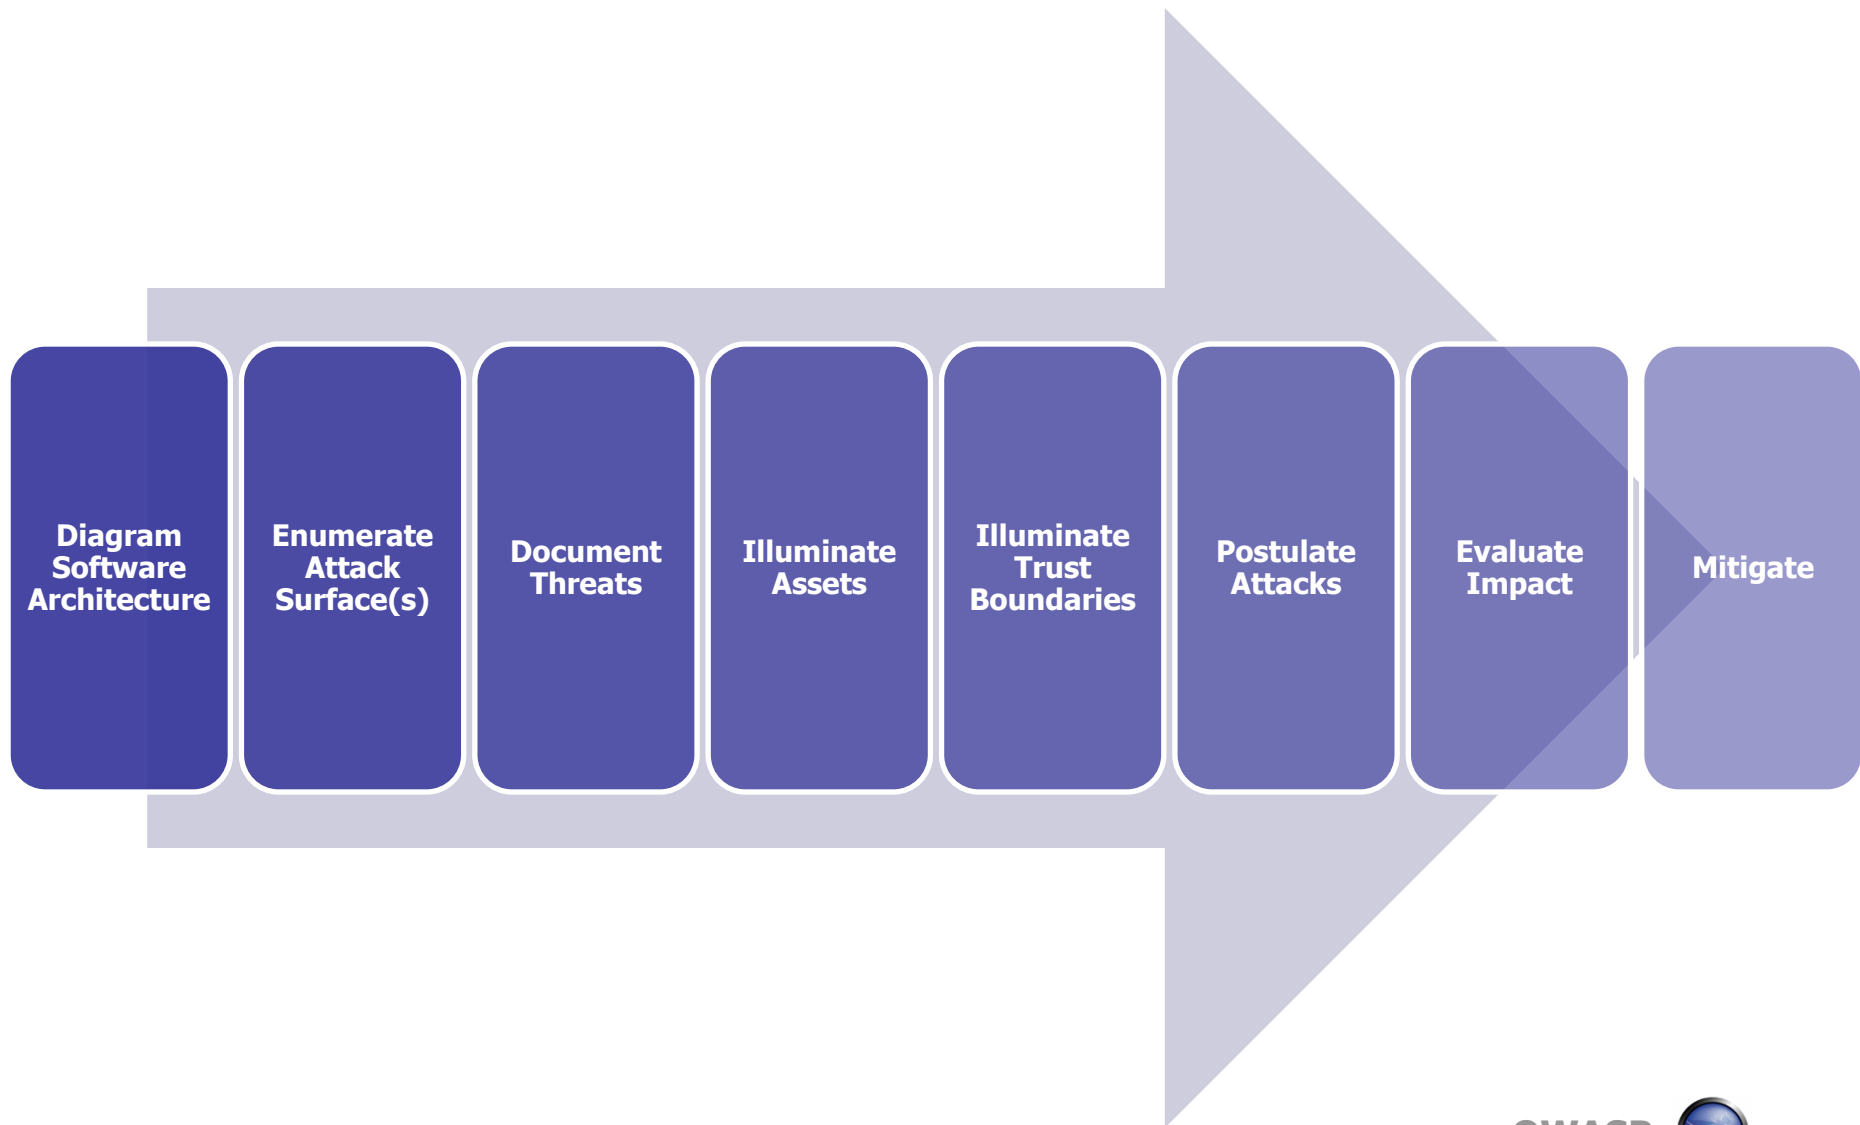

Design

- High level architecture
- Low level design
